Outline

- Project
- Book
- Criteria
- Results
- Claims

Project: Motivation

- Quantum computing may provide awesome computational power; e.g. ~2 minutes rather than 5+ trillion years to factor a 5,000 digit number.
- New quantum algorithms may support new applications and/or help to answer open theoretical questions.
- But discovery of new quantum algorithms is hard!
- Goal: automated discovery of new and useful quantum algorithms.

Project: Approach

- Use genetic programming to discover new quantum algorithms.
- Assess “fitness” via quantum computer simulation.
- Various algorithm/genetic encodings for various problem classes.

Criteria

(B) The result is equal to or better than a result that was accepted as a new scientific result at the time when it was published in a peer-reviewed scientific journal.

(D) The result is publishable in its own right as a new scientific result independent of the fact that the result was mechanically created.

(D*) Would satisfy criterion D if not for my own prior publication (with coauthors) of different but functionally equivalent evolved quantum programs, which themselves did clearly satisfy criterion D.

Results

- 1-bit Deutsch-Jozsa (XOR) problem
- 2-bit Grover database search problem
- 1-bit OR problem
- 2-bit AND/OR problem

1-bit Deutsch-Jozsa (XOR) problem

- Determine whether the behavior of a black-box quantum oracle satisfies the XOR property using only one call to the oracle.
- Result produced by genetic programming with PushGP.

Figure 8.3. Gate array diagram for an evolved solution to the Deutsch-Jozsa (XOR) problem. The “f” gate is the oracle. The “SRN” gate with the diagonal line through it on qubit 0 transposed Square Root of NOT gate.

2-bit Grover database search problem

- Determine the location of a single marked item in a 4-element quantum database using only one call to the database access function.
- Result produced by genetic programming with PushGP.

(Diagram on next slide)

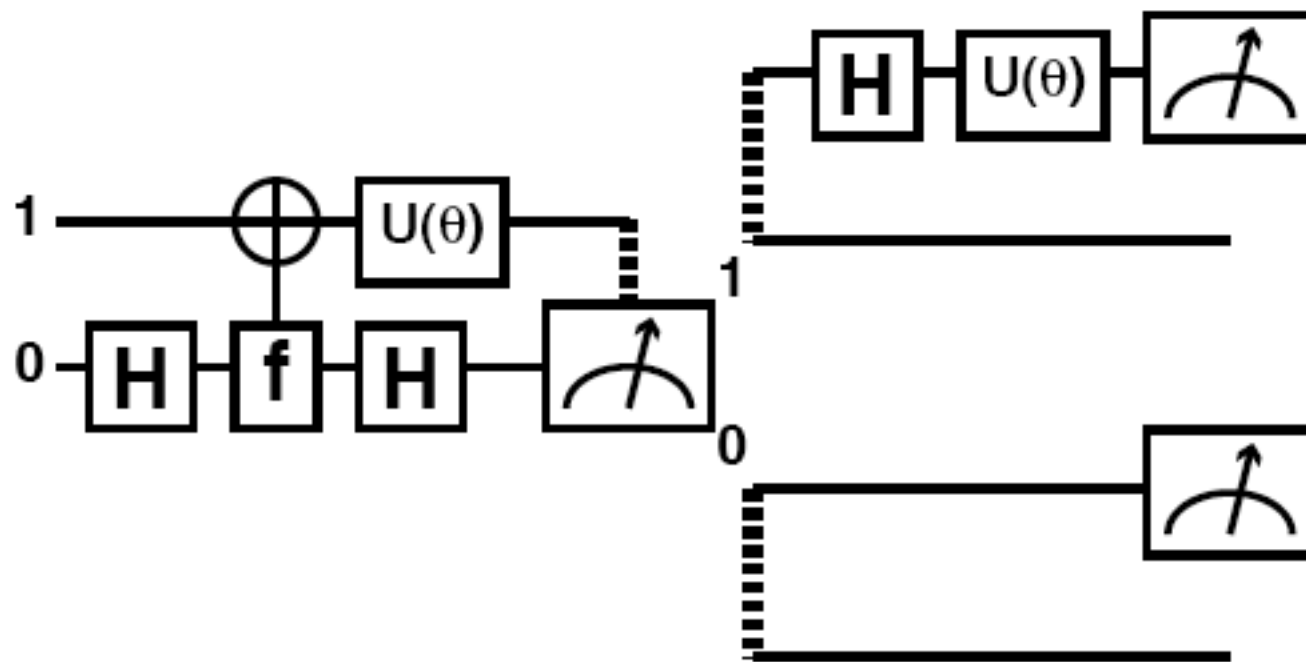

Figure 8.7. A gate array diagram for an evolved version of Grover's database search algorithm for a 4-item database. The full gate array is shown at the top, with M_1 and M_2 standing for the smaller gate arrays shown at the bottom. A diagonal line through a gate symbol indicates that the matrix for the gate is transposed. The "f" gate is the oracle.

1-bit OR problem

- Determine whether the behavior of a black-box quantum oracle satisfies the OR property using only one call to the oracle, with a probability of error no worse than 0.1.
- Result produced by genetic programming with PushGP.

(Diagram on next slide)

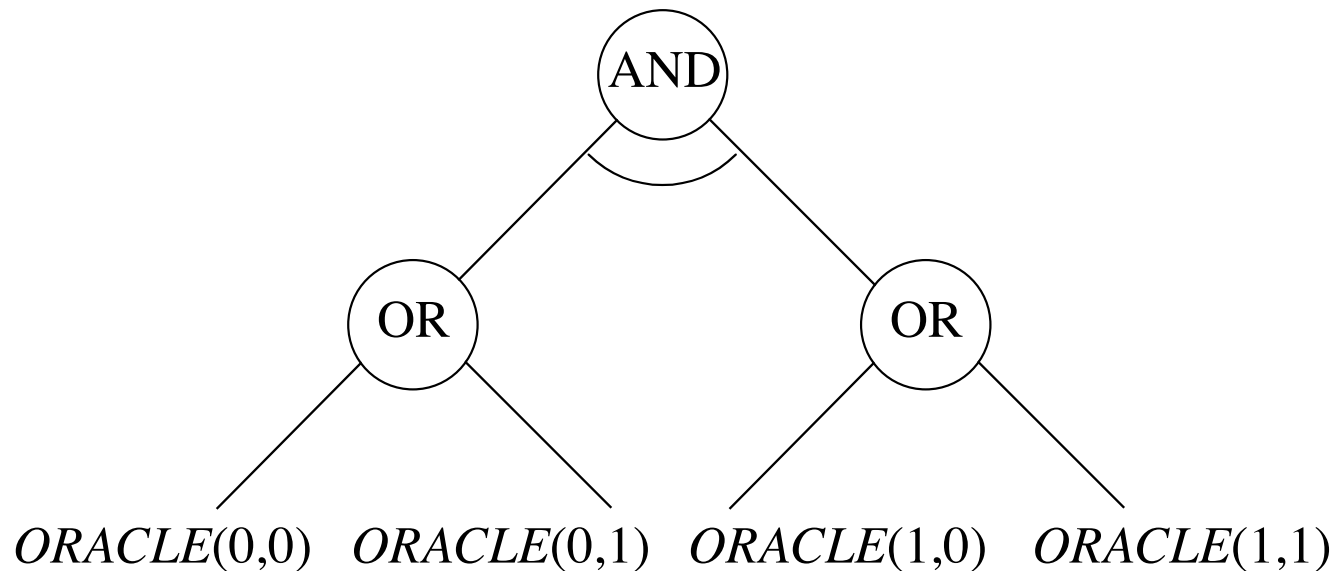

$$\theta=5.96143477$$

Figure 8.9. A gate array diagram for an evolved solution to the OR oracle problem. The gate marked “f” is the oracle. The two sub-diagrams on the right represent the two possible execution paths following the intermediate measurement. In the bottom sub-diagram the result of the intermediate measurement is 0 and the result of the overall computation is read immediately from the other qubit. In the top sub-diagram the result of the intermediate measurement is 1 and additional gates are applied to the other qubit prior to the final measurement.

2-bit AND/OR problem

- Determine whether the behavior of a black-box quantum oracle satisfies the AND/OR property using only one call to the oracle, with a probability of error no worse than 0.2874.
- Result produced by genetic programming with PushGP.

(Diagram on next slide)

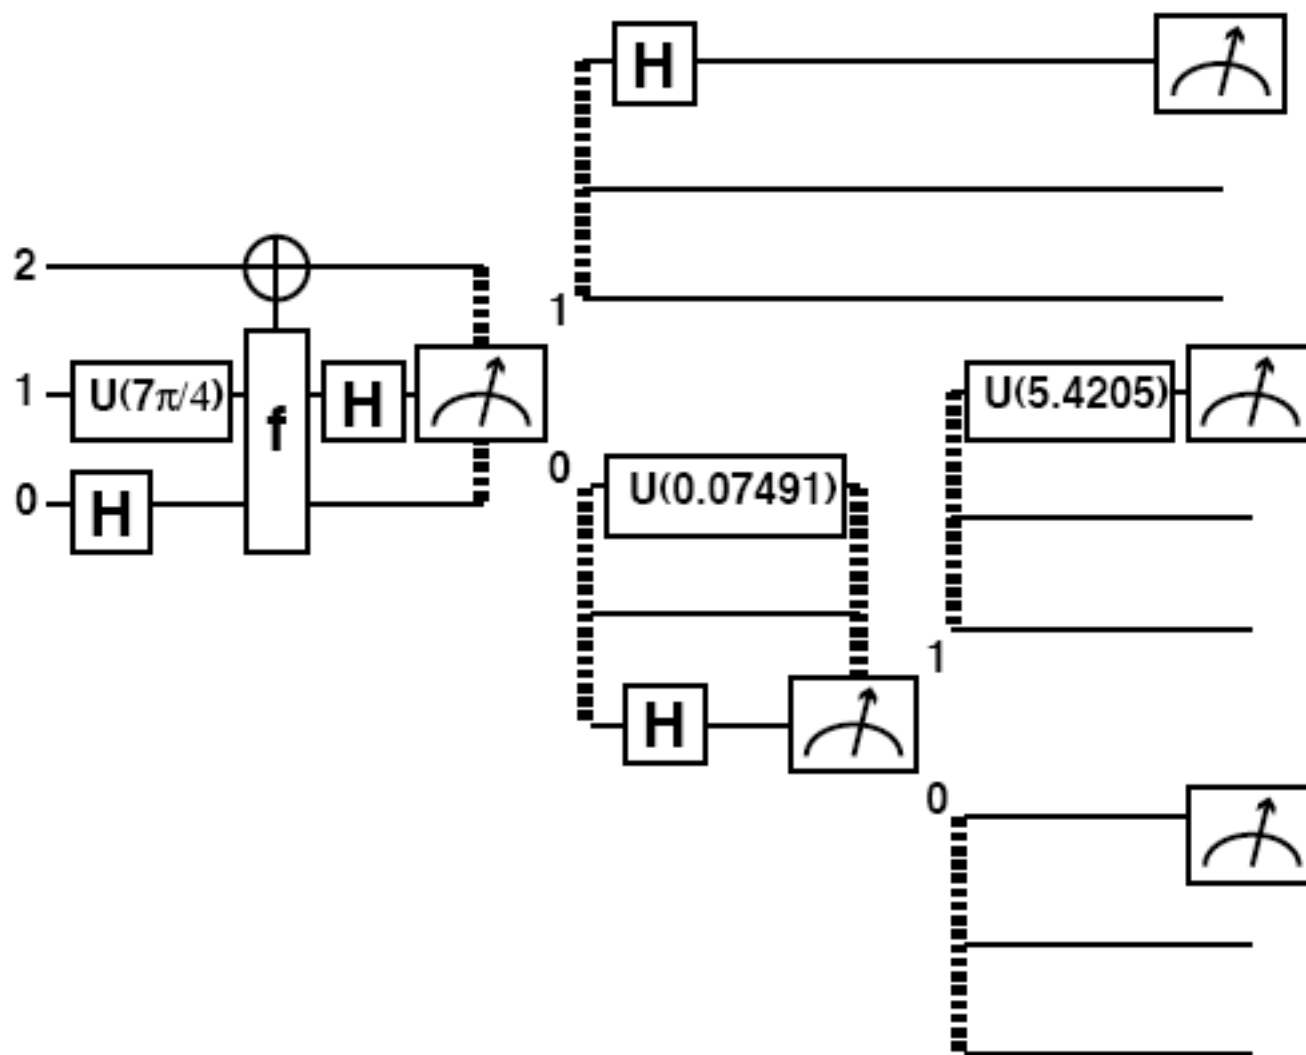

Figure 8.11. A gate array diagram for an evolved solution to the AND/OR oracle problem. The gate marked “f” is the oracle. The sub-diagrams on the right represent the possible execution paths following the intermediate measurements.

Claims

- 1-bit Deutsch-Jozsa (XOR) result: **B**
EVIDENCE: Original results (by Deutch, Jozsa, and others) were published as new and significant results.
- 2-bit Grover database search result: **B**
EVIDENCE: Original results (by Grover) were published as new and significant results.
- 1-bit OR result: **B, D***
EVIDENCE: The first quantum program solving this problem, which was produced by genetic programming, was published by Barnum, Bernstein and Spector in *Journal of Physics A: Mathematical and General*.
- 2-bit AND/OR result: **B, D***
EVIDENCE: The first quantum program solving this problem, which was produced by genetic programming, was published by Barnum, Bernstein and Spector in *Journal of Physics A: Mathematical and General*.

Notes

All of the presented results are better than can be achieved with classical computing (even probabilistic computing). They rely on specifically quantum computational effects.

The book contains additional human-competitive results (for example, in Section 8.5, “Gate Communication Problems”), but those were previously published before July 1, 2003.
